CB Couplings
Cryogenic Break-Away Couplings

Operating Manual
1” – 6”
Foreword

This operating manual applies to the person or persons using the Cryogenic Break-Away Couplings.

It is very important to read and understand this operation manual before use of this coupling. Become familiar with the unit’s operation, applications and limitations. Be particularly aware of its specific hazards. Store this manual in a clean area and always at a readily available location. Additional copies at no charge can be obtained through written requests.

IMPORTANT!!
READ THE COMPLETE DOCUMENTATION

The base for this manual follows the EC-Directive:

Pressure Equipment Directive
97/23/EG of the 29th of May 1997

- Do not make modifications that are not authorized by the manufacturer.
- Read and respect all warnings and instructions provided to you.
- Use only original Mann Teknik spare parts for maintenance.

1 INTRODUCTION

1.1 INTENDED USE

The Cryogenic Break-Away Coupling (CBC) acts as a safety component in the supply line of mobile systems, preventing damage to personnel and environment, instead of a supply hose or pipe rupture during filling or emptying due to a change in location of the tank. The coupling valves on the tank and on the supply line immediately close whenever the CBC halves separates.

The CBC is specially designed for trouble free operation in cryogenic service conditions down to -196°C. Reliable and safe operation is dependent upon the correct installation and handling of the equipment. Regular and appropriate maintenance is essential to ensure both safety and reliability over the life of the equipment. Take care that the product is only used inside the limits of the following product specification.

There are two kinds of CBCs available. A marine type version is designed for offshore applications. The specific design requires an installation between two hoses. It is only possible to release the coupling by axial force.

The length of the hose segments should not be less than \( L = a/57.3 \times (r+d/2) \).

\[
L = \text{min. required hose length} \\
a = \text{max. bending angle} \\
r = \text{min. bending radius} \\
d = \text{outer hose diameter}
\]

The second CBC type is an industrial version. Regularly it is connected to a tank or a fix connection point inside a loading station on one side and a hose or a loading arm on the other side. This makes that the CBC can be released under a pull force angle up to 90°.
Operating Manual
Cryogenic Break-Away Couplings

1.2 PRODUCT SPECIFICATION

Product name: Cryogenic Break-Away Coupling
Sizes: 1", 2", 2½", 3", 4" and 6"
Thread Connection: NPT-Thread ANSI B1.20.1
Flange Connection: Flange EN 1092, ANSI B16.5
Other Connection: On request
Material: EN 10272 – 1.4401/1.4404+AT
ASTM A479 – S31603 (316L)
Working pressure: 10 bar / 16 bar / 25 bar / 150 psi / 300 psi
Max test pressure: 16 bar / 25 bar / 40 bar / 240 psi / 450 psi
Temperature range: -196ºC to +80ºC

1.4 BREAKING PINS

Mann Teknik AB delivers breaking pins according to customer specification. The breaking force should be specified for the weakest component.

Without any specification we supply our couplings with bolts according to the following table.

Example: On the ID-plate of the coupling the mentioned pressure rate is 25 bar. If the minimum burst pressure of the hose is 4 times 25 bar = 100 bar. For a DN65 (2½”) coupling the standard breaking bolts are 22 kN.

Table 4: Recommended breaking force for different hose burst pressures:

</table>

For your special application you can specify the breaking force depending on the burst pressure of your hose or depending on another weak point in your installation.

The breaking forces become reduced by increasing internal pressure. The influence per nominal diameter is independent from the breaking bolts. The following table shows the influence.

Table 5: Reduced force to release the coupling because of internal pressure

<table>

1.6 **SCOPE OF DELIVERY**

1 pcs NC313D44 Cryogenic Break-Away Coupling

In case of flange connection gaskets and bolts to mount the coupling into the application is not part of the delivery. For NPT thread use PTFE tape for sealing (see chapter 4.2).

2 **GENERAL SAFETY RULES**

For a safe operation, read this manual completely before operating this product.

Failure to follow the warnings may result in serious personal injury, property damage, leakage or unexpected separation.

Before you install any Mann Tek equipment it is essential to check that the material and performance specifications are acceptable for your specific application. The pressure ratings and primary materials of the couplings are clearly indicated on the identification plate of each Mann Tek product. A drawing showing the materials of construction relating to each individual component is available upon request. Specification checks should always be carried out before the product is supplied, but if unsure, ask!

As with all equipment, a check should be made to ensure that the installation fulfils the requirements of applicable prevailing industry, local, national and international standards. Particular attention should be paid to pressure ratings, safety factors and the position of upstream and downstream affiliated closures.

2.1 **SAFETY INSTRUCTIONS**

Wear proper safety clothing consists of thermal gloves, full face shield approved for cryogenic use and solid shoes capable to withstand cryogenic
Operating Manual
Cryogenic Break-Away Couplings

spill whenever operating Cryogenic Break-Away Couplings.

- Make sure the operating space is clear to avoid accidental contact with others and the coupling interface is clean and dry. Use dry air or nitrogen to blow out the coupling interface.
- Do not use the CBCoupling in any way, not described in the specification. The user is responsible to comply with all applicable federal, state and local laws and regulations.
- Do not operate the CBCoupling if there is any visible damage. Stop immediately if leakage occurs.
- Make sure that there is no trapped liquid or excessive pressure.
- Authorized and qualified personnel must carry out all assembly and maintenance operations as described in this operating manual.

3 TRANSPORT AND STORAGE

The product may only be transported or stored absolutely clean. Suitable protection must be used for both openings to ensure no damage occurs to the surfaces/sealed areas. The storage location must guarantee adequate protection from corrosion or extreme temperatures.

3.1 DELIVERY CHECK
- Check for any transportation damage. If so report this immediately to the forwarder.
- Check that the products and quantities are in accordance with the delivery note.

3.2 COMPLAINTS / RETURN OF GOODS
- If returning goods please contact Mann Teknik AB to receive a Complaint Report form.
- Complete the form with as much details as possible.
- Return the goods with the Complaint Report attached on the outside of the package!

3.3 STORAGE
Store coupling in a dry, dust free, dark place, in ambient temperature.
4 INSTALLATION

4.1 INITIAL OPERATION

The correct installation of all Mann Tek products is essential to ensure safe and satisfactory operation. Checks should be made to ensure that the fitting of Mann Tek products does not interfere with the correct operation of affiliated equipment (i.e. isolation valve, excess flow valves, etc). Before securing the flange or thread connections to mating equipment (i.e. hose, loading arm and storage tank) ensure that no foreign objects, dirt, grit, water (moisture) etc. are present in the coupling.

All flange and thread connections should be made without imparting excessive strain to the equipment. All gaskets and sealing materials used to make the permanent connection should be of suitable material.

Each Mann Tek product is designed to take reasonable axial loads associated with good handling practice but is not designed to accept continuous excessive load values associated with maladjustment or poor installation. Continuous excessive strain will equate to increased component wear and possibly premature failure if not corrected.

When Mann Tek equipment is used with hoses, attention should be paid to hose length to ensure correct handling characteristics. The hose assembly should be designed such that the minimum hose length is supported by the coupling or the operator. Hoses should be of sufficient length to ensure operation well within the stipulated hose minimum bend radius up to the maximum operation envelope.

4.2 INSTALLATION

When installing Mann Tek equipment to new pipe work, tanks, etc. ensure the system is free from debris that may be transferred through the coupling. Where the hose or loading arm assembly is the primary static dissipation or earth route, the electrical continuity value of the assembly shall be checked to ensure regulatory compliance. Special attention should be paid to the balancing of loading arms. It is usual for loading arm balance settings to account of weight variations due to differences in the full / empty cycle. The loading arm should be set to balance in the condition present at the time of connection.

Before mounting the CBCouplings ensure that trapped liquid never can occur in the installation. In combination with a Dry Cryogenic Coupling or Emergency Shut Down Valve measures shall be taken to ensure that no liquid can be trapped in any operating mode. Then the CBCoupling can be installed directly in the product line and is ready for use after removing the transport protection.
Operating Manual
Cryogenic Break-Away Couplings

The installation is as follows:

- Remove the packaging.
- Check the coupling for damages before mounting.
- Ensure that the product line is empty and all valves are closed before you assemble the coupling into the line.
- To prevent damages during mounting a suitable wrench should be used for the intended nut flats on the coupling (threaded connection) or the bolts (flanged connection).

The start-up may take place only when the CB Couplings has been mounted as instructed and the necessary function tests and leak tests have been conducted by the approved authorities.

5 OPERATION

5.1 GENERAL NOTES
Operators are obliged to provide qualified and trained personnel familiar with the handling of supply pipes, safety couplings, any fluid being pumped as well as its danger potential. Such staff must also be familiar with the applicable safety regulations and the regulations of the employer’s liability association.

5.2 DAILY VISUAL INSPECTION
All couplings should be inspected at the start of each day’s operation. Check for leakage and any obvious physical damage (such as impacts, etc.).

5.3 DISMANTLING
When the DC Coupling are taken out of service, the risk of liquid or gas spurting out should be taken into consideration. Special protective measures such as personal protection equipment must therefore be adopted.
Operating Manual
Cryogenic Break-Away Couplings

How to dismantle:

a. Wear suitable personal safety equipment.
b. Make sure that the coupling is depressurized and empty.
c. Unscrew coupling always with a wrench fit for purpose.

5.4 IMPROPER USE
The equipment should never be used in the case of visible damage or where there is prior knowledge of damage that may lead to malfunction.

6 MAINTENANCE AND REPAIR

6.1 GENERAL INFORMATION
The CBCoupling consists of two housing halves with a check valve in each. The housings are held together by three breaking bolts during normal operation. The two check valves support each other during normal operation and keep the conduit open.

In case the supplying tank, e.g. a tank truck, moves from the filling area and someone forgot to disconnect the supply line, the CBC is activated as follows:
Before the supply line is stressed by undue external forces the breaking pins will break. The CBC halves are separated from each other and the spring-loaded check valves instantaneously close both ends of the line. On the industrial version one half of the coupling remains firmly connected to the tank wagon while the other half of the coupling remains connected to the supply line. The marine type is always placed between two hoses. The pull force is only working in axial direction. After releasing both halves remain at the end of each hose. This prevents the outflow of liquids or gases from both product carrying ends of the line.
Operating Manual
Cryogenic Break-Away Couplings

Maintenance tasks, to put the released coupling back into service, may be performed only by trained personnel from an authorised professional workshop. All measures necessary for inspection, maintenance and repair must be carried out in accordance with the national regulations of the country where the system is installed.

6.2 MAINTENANCE AND SERVICE INSTRUCTION

Always depressurise the system and rinse off the parts before beginning any maintenance work. Use protective goggles. Do not handle O-ring seals if the material appears charred, gummy or sticky.

Use tweezers; wear gloves and protective goggles in appropriate material, consult the material safety data sheet (MSDS) of your product. Do not touch adjacent parts with unprotected hands. Rinse off the parts once again before starting the “daily inspection”

6.3 SPARE PARTS AND TOOLS

Breaking-bolt-kit

3 Breaking bolts.

In case of failure or break away order the CBC-BOLT SET and carry out repairs according to the assembly instructions.

Attention: Do not forget to specify the proper size and breaking force! Please check with the information on the ID-plate and the head of the bolt.

Outer body sealing ring

6.4 RESETTING AFTER RELEASE

Dismantling

When the coupling are taken out of service and dismantled there is a danger that the fluid will spurt out. Special protective measures such as personal protection equipment must therefore be adopted.

a. Wear suitable personal safety equipment.
b. Make sure that the coupling is depressurized and empty.
Visual inspection

Screw out the destroyed parts of the breaking bolts.

Check for dirt, seal damage and any obvious physical damage (such as impacts, etc.).

Outer body sealing ring

Replace the sealing ring on the body with a new one.

Make sure that the seal doesn’t get scratched when mounting. The open profile should be in the direction which is shown in the picture.

Breaking bolts

Replace the bolts only by original spare parts from Mann Tek with the same breaking force.

Example shows 13 kN breaking bolts

Breaking bolts

Screw in the bolts into the intended position.
Breaking bolts
If necessary tighten the bolt with a wrench.

Fix breaking bolts
Screw on the nuts by hand until stop when halves are pressed together.

⚠️ Do not use force for tightening! Risk of destroying bolts.

Fix breaking bolts
Fasten it a little bit with a wrench, max 45 degrees.

Tool: Standard wrench 10mm

⚠️ It is important that all 3 bolts are mounted in the same way. Risk that 1 bolt will be destroyed before the others.

Fix breaking bolts
Screw on the second nut and lock the first one. Hold the first one with a wrench to avoid forces on the breaking bolt.

After the coupling is completely reassembled provide a pressure test according to test procedure on page 10.
Operating Manual
Cryogenic Break-Away Couplings

6.5 Pressure and Tightness Test

After each service a pressure and tightness test of each coupling is mandatory. Test each half separately before you connect both halves with the breaking pins. The following test parameters are in accordance with EN12266 and ISO5208:

Shell tightness test: \(1,5 \times \text{Working Pressure}\) stop time 1 min.
Seat tightness test: \(6 \text{ bar } \pm 1\text{ bar}\) stop time 15 s.
\(0,1 \times \text{Working Pressure}\) stop time 15 s.

Instead of water we recommend to make the tightness test with gas, e.g. N2. If water is used as testing media, after testing all water must be removed from the couplings to avoid freezing under low temperature service.

If a pressure test should be achieved for the coupling mounted in an assembly follow the respective test instructions for the equipment but do not exceed our recommended maximum test pressure of the coupling which you will find in the following table. If testing with higher pressure is necessary please ask our sales department for a special test bolt kit.
