## Full range of cam locking coupling from Elaflex

Refuelling equipment manufacturer Elaflex has revealed a full range of cam locking couplings adhering to the EN 14420-7 standard in every regard.

The couplings are reliable, leak-proof, and operationally safe, available in sizes DN19 to 100mm.

The cam lock coupling are manufactured in stainless steels with female BSP thread connection or with integrated hose tail and with brass and aluminium types in preparation.

Apart from the commitment to comply or exceed the EN standard requirements, the new coupling design also features new rugged and ergonomically shaped levers for improved handling.

With the new range, Elaflex is confronting a market trend towards ever worsening qualities which can cause leakage and workplace accidents.

The couplings feature wall thicknesses and tolerances to industry standard, with material test certificates 3.1 available on request.

A pressure safety rating PN 16 bar for all materials provides the couplings with a high safety factor.

The products are available as a male/female coupling with female BSP thread, male/female coupling with integrated hose tail, and as dust caps and plugs.
